Implementation Rules for Compulsory Certification of Electrical and Electronic Products

Telecommunication Terminal Equipment

1. Scope

The document is applied for the compulsory certification for telecommunication terminal equipment.

Telecommunication Terminal Equipment refers to the telecommunication equipment that provide message sending and receiving function at the end of public telecommunication network. The telecommunication terminal equipment defined in the document include fixed telephone terminal, cordless telephone terminal, corporate phone, fax machine, modem (including card), mobile terminal, ISDN terminal, data terminal (including card), multimedia device, etc.

2. Authentication mode

Type test + initial factory inspection + Follow-up inspection

3. Basic process of Certification

- 3.1 Apply for certification
- 3.2 Prototyping Test
- 3.3 Initial Factory Inspection
- 3.4 Certification Result Evaluation and Approval
- 3.5 Follow-up Inspection

4. Basic requirements for Certification Implementation

- 4.1 Apply for certification
- 4.1.1 Application Unit Division
- 4.1.1.1 Apply for certification based on product model on principle

Products of same type under the same manufacturer but produced in different factories shall apply for test as separate unit. Type test is performed on the samples from the same factory, and the samples and related materials of other factories are required if necessary for conformity test.

4.1.1.2 The same parts (parts with * in Annex 3) in the product electrical structure and product security, which impact seriously on product EMS are viewed as a same unit for the certification. The specific model in the single unit shall be identified in principle. For the specific application

units for certification, see Appendix 1.

4.1.2 Document delivered in application

The applied certification shall deliver the formal application and attach the following files:

- (1) Electrical circuit diagram related to safety and EMC (e.g. electrical circuit diagram of power supply) and/or system block diagram/mounting structure of the unit;
 - (2) Key components and/or primary material list;
 - (3) Chinese Instruction
 - (4) Chinese nameplate and alarm markup;
- (5) The difference description between various models of the products in the same applied unit;
 - (6) Other required documents (e.g. Maintenance manual).
- 4.2 Type Test
- 4.2.1 Sampling for Type Test
- 4.2.1.1 Sampling principle

If there is only a model in the applied unit, the sample of this model is delivered.

For the test of series of products as the same unit, we shall select the representative model from it, and the selected samples shall cover the security requirements and EMS requirements of the series of products. If not covered, we shall select and send other products in this unit for the supplementary test.

For unit test, key safety components (Annex 2) in the unit shall be tested separately as required. The key safety components that have been certified and awarded with the compulsory product certification or voluntary certification whose test result accepted for the compulsory product certification result according to CNCA regulation are exempted from separate test, but the samples and relevant materials and documents are required for audit.

4.2.1.2 Number of samples

The applicant is responsible to select and send the samples for type test based on the certification authority. See Annex 1 for the number of samples for the machine. For the number of samples for the separate safety test along with the machine test, and the related requirement, see Annex 2.

4.2.1.3 Disposal of type test sample and related documents

After the type test, it shall process the test samples and/or related materials in the suitable manner.

4.2.2 Criteria, Items and Method of Type Test

4.2.2.1 Test Standards

GB 4943 Security of IT Equipment

YD/T 993 Lightening-proof technical requirements and test methods of

Annex 5: Factory Quality Assurance Capability Requirements

To ensure the conformity of the certification products in batch production and the samples with qualified type test, the factory shall meet the quality assurance capability requirements defined by this document.

1. Responsibilities & Resource

1.1 Responsibilities

The factory shall define the responsibilities and the relationship of the staff related to the quality activities, and it shall specify a quality person in charge, whatever he is responsible for, he shall have the following responsibilities and rights:

- a) set up the quality system to meet the requirements in the documents and ensure the implementation and maintenance;
- b) Ensure the products marked the compulsory certification meet the requirements for certification standard;
- c) Set up the documented procedure and ensure the proper safekeeping and use of the certification mark;
- d) Set up the documented procedure and ensure to unmark the compulsory certification for the unqualified products and products awarded with the certificate changed but not approved by the certification authority.

The quality manager shall have full competent to perform his job.

1.2 Resource

The factory shall be equipped with the necessary production equipment and inspection equipment to meet the requirements that products meet the compulsory certification standard; it shall have the appropriate the human resource ensure the staff who impacts on the product quality have the necessary capability; it shall set up and maintain the necessary environment in production, inspection, test, storage and other operations of the production.

2. Documents and Record

2.1 The factory shall set up and maintain documented quality plan or similar documents for the certificated products, and ensure the documents required to operate and control the relevant procedures of product quality. The quality plan shall include the definition of product design target, implementation procedure, detection and related resources, and the definition of the change of certified products (standards, process, key part, etc.) and the mark usage management and other definition.

Product design standard or specification shall be a content in the quality plan, which requirements shall be not lower than the standard requirements defined in certification regulation of this product.

2.2 The factory shall set up and maintain the documented procedure to control the file and

material required in this document effectively. The control shall ensure:

- a) The authorized staff shall approve the release and change of the document before the implementation to ensure the suitability;
- b) The change and revision of the document shall be identified to prevent the unexpected use of obsolete documents;
 - c) Ensure to get the valid version of corresponding document at use.
- 2.3 The factory shall set up and maintain the identification, storage, safekeeping and processing and other documented procedures of quality record. The quality record shall be clear and complete as the basis for product compliance.

The quality record shall have the appropriate storage life.

- 3. Purchasing and Receiving Inspection
- 3.1 Supplier control

The factory shall develop the selection, evaluation and routine management procedures of key components and materials providers, to ensure the provider shall have the capability to meet the requirements for key components and materials.

The factory shall store the selection evaluation and routine management record of the providers.

3.2 Inspection/verification of key components and material

The factory shall set up and maintain the inspection or test procedure of key components and materials provided by the provider and regular acknowledgement of inspection procedure, to ensure the key components and materials to meet the requirements defined by the certification.

The inspection of key components and materials can be performed by the factory or the supplier. When it is performed by the supplier, the factory shall propose the clear inspection requirement for the supplier.

The factory shall store the inspection or test records of key components, confirm the inspection record and the conformity certification and relevant inspection data provided by the supplier.

- 4. Control and inspection of production procedure
- 4.1 The factory shall identify the key production work order, and the operator in the key work order shall have the appropriate capability. If the work order has no document definition, and the product quality is not guaranteed, we shall develop the corresponding processing guideline to control the production.
- 4.2 The environment is required during the production, and the factory shall ensure the working environment meets the defined requirements.

We shall record the operation inspection result and taken adjustment actions.

7. Control of unqualified products

The factory shall set up unqualified product control procedure, including ID method, isolation, processing and correction and precaution actions taken of unqualified products. The repaired and reworked products shall be tested again. The repairing for important parts or components shall be record accordingly and the processing record of unqualified products shall be stored.

8. Internal quality audit

The factory shall set up the documented internal quality audit procedure to ensure the effectiveness of quality system and the conformity of certification products and record the internal audit result.

The complaints on the factory, especially on the non-conformity products shall be stored, and be input as the internal quality audit.

The question during the audit shall be taken correction and precaution action and be recorded.

9. Conformity of Certificated product

The factory shall control the conformity of batch products and products with the qualified type test to make the certification products meet the defined requirements.

The factory shall set up the change and control procedures of key components and materials, structures that impact on the product compliance. The change of certification products (that may impact on the conformance of the related standard or the conformity of type test machine) shall be approved by the certification authority before the implementation.

10 Packaging, Transportation and Storage

Any packaging, handling and storage environments performed in the factory shall not impact the product compliance requirement.

--- END ---
